

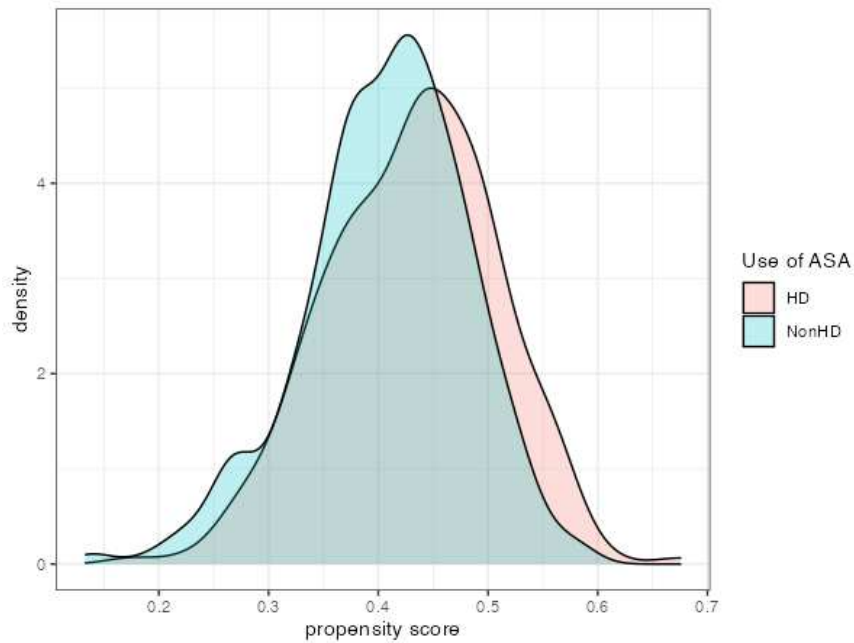

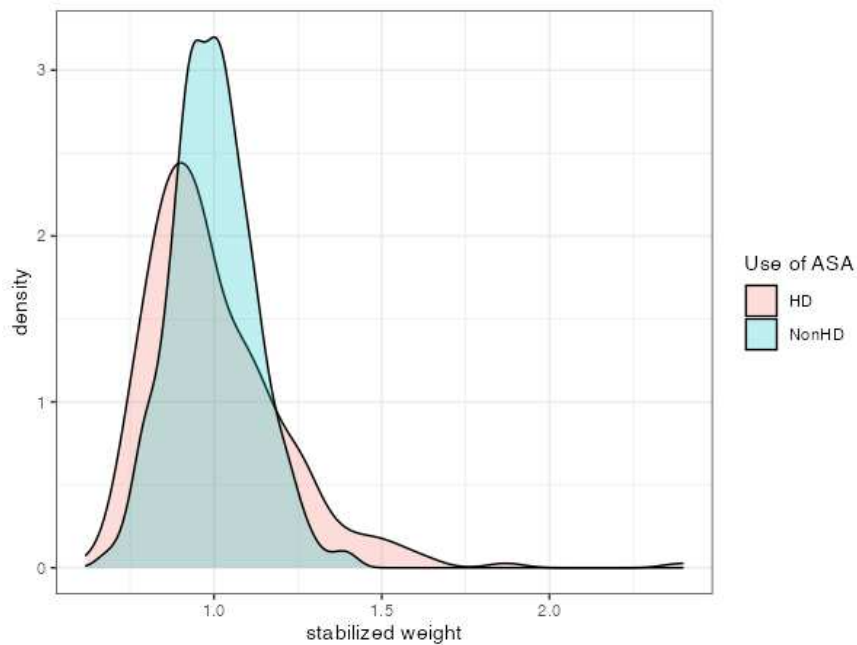

Figure S1a. Distribution of propensity scores in the HD and non-HD groups.**Figure S1b.** Distribution of stabilized weights in the HD and non-HD groups.

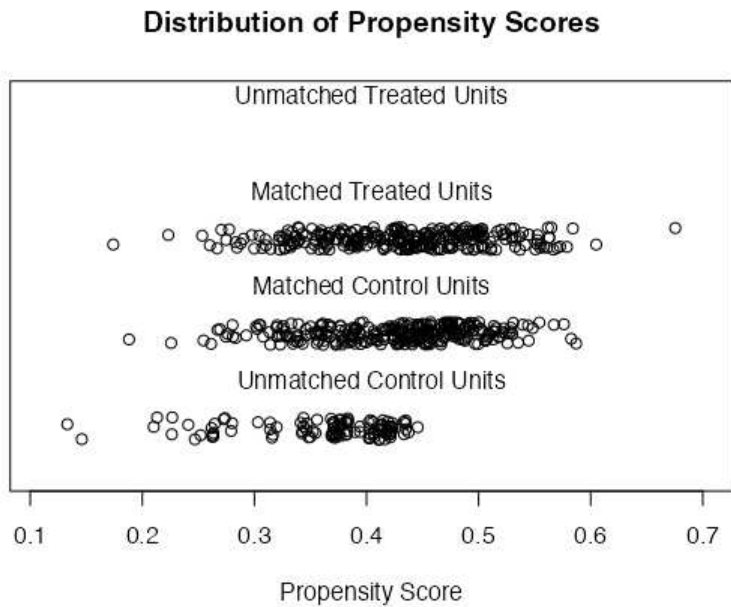

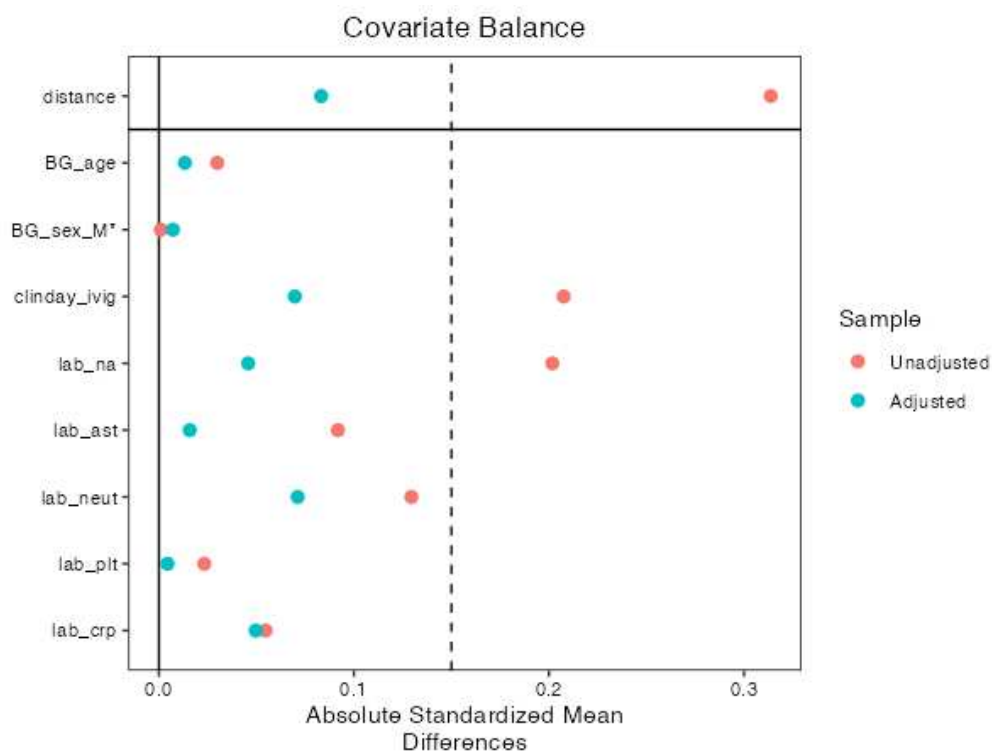

Figure S1c. Distribution of propensity scores in the matched cohort.**Figure S1d.** Covariate balance before and after matching. Covariates were well-balanced after propensity score matching.

Figure S2a. Posterior probability distribution with minimally informative prior showed the incidence of CALs in the HD group was higher than that in the non-HD group.

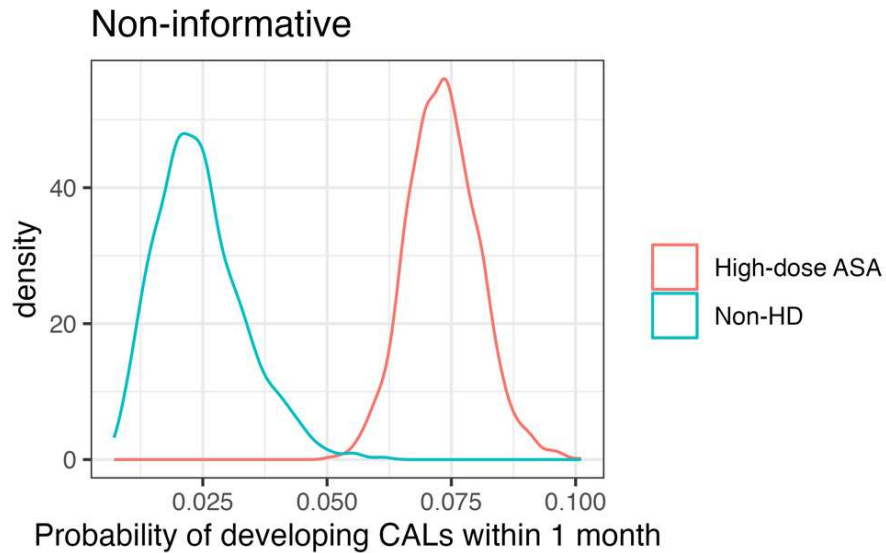

Figure S2b. Posterior probability distribution with skeptical prior.

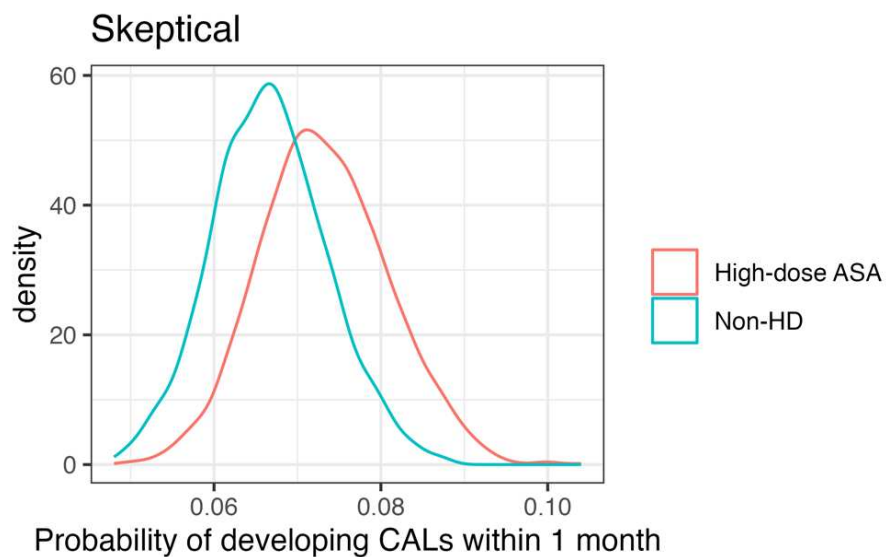

Figure S2c. Posterior probability distribution with moderately enthusiastic prior showed the posterior probability of both groups was similarly distributed.

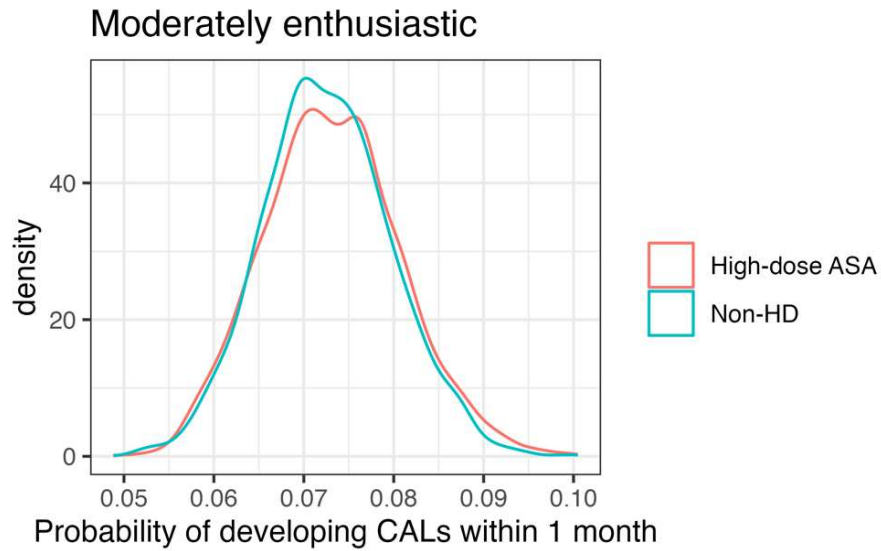

Figure S2d. Posterior probability distribution with strongly enthusiastic prior.
